[0068] FIG. **15** is a schematic diagram illustrating an embodiment of a user interface for a portable electronic device.

[0069] FIG. **16** is a flow diagram of an embodiment of a symbol entry process.

[0070] FIG. **17** is a schematic diagram illustrating an embodiment of a user interface for a portable electronic device.

[0071] FIG. **18** is a flow diagram of an embodiment of a symbol entry process.

[0072] FIG. **19** is a schematic diagram illustrating an embodiment of a user interface for a portable electronic device.

DESCRIPTION OF EMBODIMENTS

[0073] Reference will now be made in detail to embodiments, examples of which are illustrated in the accompanying drawings. In the following detailed description, numerous specific details are set forth in order to provide a thorough understanding of the present invention. However, it will be apparent to one of ordinary skill in the art that the present invention may be practiced without these specific details. In other instances, well-known methods, procedures, components, and circuits have not been described in detail so as not to unnecessarily obscure aspects of the embodiments.

[0074] Embodiments of user interfaces and associated processes for using a device are described. In some embodiments, the device may be a portable communications device. The user interface may include a click wheel and/or touch screen. A click wheel is a physical user-interface device that may provide navigation commands based on an angular displacement of the wheel or a point of contact with the wheel by a user of the device. A click wheel may also be used to provide a user command corresponding to selection of one or more items, for example, when the user of the device presses down on at least a portion of the wheel. For simplicity, in the discussion that follows, a portable communications device (e.g., a cellular telephone that may also contain other functions, such as SMS, PDA and/or music player functions) that includes a touch screen is used as an exemplary embodiment. It should be understood, however, that the user interfaces and associated processes may be applied to other devices, such as personal computers and laptops, that may include one or more other physical user-interface devices, such as a click wheel, a keyboard, a mouse and/or a joystick.

[0075] The device may support a variety of applications, such as a telephone, text messaging, word processing, email and a music player. The music player may be compatible with one or more file formats, such as MP3 and/or AAC. In an exemplary embodiment, the device includes an iPod music player (trademark of Apple Computer, Inc.).

[0076] The various applications that may be executed on the device may use at least one common physical user-interface device, such as the touch screen. In embodiments that include a click wheel, one or more functions of the click wheel as well as corresponding information displayed on the device may be adjusted and/or varied from one application to the next and/or within a respective application. In this way, a common physical architecture (such as the click wheel) of the device may support the variety of applications with user interfaces that are intuitive and transparent.

[0077] The user interfaces may include one or more keyboard embodiments. The keyboard embodiments may include standard (qwerty) and/or non-standard configurations of symbols on the displayed icons of the keyboard. The keyboard embodiments may include a reduced number of icons (or soft keys) relative to the number of keys in existing physical keyboards, such as that for a typewriter. This may make it easier for users to select one or more icons in the keyboard, and thus, one or more corresponding symbols. The keyboard embodiments may be adaptive. For example, displayed icons may be modified in accordance with user actions, such as selecting one or more icons and/or one or more corresponding symbols. One or more applications on the portable device may utilize common and/or different keyboard embodiments. Thus, the keyboard embodiment used may be tailored to at least some of the applications. In some embodiments, one or more keyboard embodiments may be tailored to a respective user. For example, based on a word usage history (lexicography, slang, individual usage) of the respective user. Some of the keyboard embodiments may be adjusted to reduce a probability of a user error when selecting one or more icons, and thus one or more symbols, when using the keyboard embodiments.

[0078] Attention is now directed towards embodiments of the device. FIG. **1** is a block diagram illustrating an architecture for a portable electronic device **100**, according to some embodiments of the invention. The device **100** may include a memory **102** (which may include one or more computer readable storage mediums), a memory controller **122**, one or more processing units (CPU's) **120**, a peripherals interface **118**, RF circuitry **108**, audio circuitry **110**, a speaker **111**, a microphone **113**, an input/output (I/O) subsystem **106**, a display system **112** (which may include a touch screen), a click wheel **114**, other input or control devices **116**, and an external port **124**. These components may communicate over the one or more communication buses or signal lines **103**. The device **100** may be any portable electronic device, including but not limited to a handheld computer, a tablet computer, a mobile phone, a media player, a personal digital assistant (PDA), or the like, including a combination of two or more of these items. In other embodiments, the device **100** may not be portable, such as a personal computer.

[0079] It should be appreciated that the device **100** is only one example of a portable electronic device **100**, and that the device **100** may have more or fewer components than shown, may combine two or more components, or a may have a different configuration or arrangement of the components. The various components shown in FIG. **1** may be implemented in hardware, software or a combination of both hardware and software, including one or more signal processing and/or application specific integrated circuits.

[0080] The memory **102** may include high speed random access memory and may also include non-volatile memory, such as one or more magnetic disk storage devices, flash memory devices, or other non-volatile solid state memory devices. In some embodiments, the memory **102** may further include storage remotely located from the one or more processors **120**, for instance network attached storage
